ABSTRACT

5 A method for producing a low-extractable film packaging from an actinic
radiation curable aqueous composition containing a water soluble compound
having at least one α , β -ethylenically unsaturated, radiation polymerizable group
and water as essential components carried out by applying the aqueous
composition to a surface which is then irradiated with actinic radiation in the
presence of the water thereby forming a cured film wherein less than 50 ppb of the
10 water soluble compound or its residual components are extractable by a food
simulant.
